

Growth Timeline

From pilot night-flow work to repeatable DMA delivery patterns.

- Early pilot districts focused on proving night flow baselines and quick-response loops.
- Next stage projects standardized district surveys, work orders, and alarm thresholds.
- Recent programs combine leak detection with review dashboards and cross-team visibility.
- The history page attachment now ships with meaningful local narrative content.

Curated history asset used by the importer when building </about/history>.

Operating Principles

Patterns repeated across DMA implementations.

- Data should explain where to look, not replace field judgement.
- Field closure needs evidence captured back into the monitoring workflow.
- Monthly review keeps the program focused on sustainable leakage reduction.
- Local attachments make the repo self-contained for seeded demo content.

Task 6 asset refresh for repo-delivered imported content.
