

Solution Pack

Monitoring, diagnosis, response, and review in one migration-safe file.

- Frames leakage work as a sequence of monitor, diagnose, respond, and review.
- Explains how district boundaries, alarms, and field action should reinforce each other.
- Supports both the main DMA Lite solution and the pressure-zoning variant content.
- Provides a richer local attachment than the old one-line placeholder PDF.

Useful for public solution downloads that should work without network access.

Service Blueprint

Typical rollout stages for district leakage programs.

- Phase 1: baseline districts, current loss picture, and meter hierarchy cleanup.
- Phase 2: alert tuning, on-call roles, and incident review cadence.
- Phase 3: field verification packs, repair tracking, and savings reporting.
- Phase 4: governance dashboards for leaders, planners, and operations teams.

Curated to stay coherent with importer behavior and stable product slugs.
