

Technical Specs

Inputs, analytics, and operator outputs used by the product seed.

- Inputs: district flow, pressure, meter hierarchy, incident logs, and repair tickets.
- Analytics: minimum night flow baseline, district drift alerts, and closure scorecards.
- Outputs: dashboards, exception lists, maintenance work queues, and weekly summaries.
- Suitable for the linked attachment on DMA Lite and AI meter bot seed content.

This file intentionally stays local and should not be replaced by mismatched images.

Deployment Notes

Implementation guidance for pilot-to-scale utility programs.

- Start with one or two high-loss districts to validate baseline thresholds.
- Pair telemetry review with a clear incident triage and handoff rhythm.
- Add monthly governance reviews to compare savings forecasts and actual closure rates.
- Keep attachment slugs stable so importer and public download tests remain green.

Task 6 curated asset upgrade for repo-delivered imported content.
