

Case Summary

District leakage program focused on Qingyuan utility operations.

- Project teams established baseline districts before broadening to high-loss branches.
- Weekly review sessions connected alarms, crew actions, and repair confirmation.
- The seeded case content now points to a meaningful local pack instead of filler copy.
- Useful for /cases/qingyuan-water and the related nanshan DMA example.

Designed for stable local downloads used by importer and public routing tests.

Outcomes and Transferable Patterns

What the case demonstrates for future DMA deployments.

- Measure response speed, verified repairs, and district baseline drift after each cycle.
- Keep one shared view for planners, dispatchers, and field supervisors.
- Use small pilot wins to expand into broader district governance programs.
- Retain local curated case packs in git to avoid dependency on remote mismatched files.

Curated case attachment for Task 6 seed asset quality improvements.
